Abstract—Particle swarm optimization is a popular optimization algorithm used for design of microstrip patch antenna. This paper presents design of probe fed rectangular microstrip patch antenna for frequency ranges from 3-8GHz using particle swarm optimization. A substrate with dielectric constant of 2.4 and height 1.578mm has been used for the design of microstrip patch antenna. PSO has been used to optimize the parameters like patch length, width and feed position using Sonnet13.52

I. INTRODUCTION
Microstrip patch antenna has gain attention for wireless communication applications due to its low profile, low weight, low cost and small size [1]. Microstrip patch antenna is preferred for wireless communication applications. Microstrip patch antenna consists of a conducting rectangular patch of width W and length L on one side of dielectric substrate of thickness h and dielectric constant. Most popular methods to feed the microstrip patch antenna are microstrip line feed, coaxial probe feed, aperture coupled feed and proximity coupled feed. Top view of rectangular microstrip patch antenna using coaxial probe feed is shown in figure1. Probe fed [2] microstrip patch antenna shown in Fig2.uses a coaxial connector soldered to the patch.

In 1995, particle-swarm optimization (PSO) was presented by James Kennedy and Russell Eberhart. PSO is based on movement and intelligence of swarm of bees or flock of birds [3] [4]. A swarm of bees whenever fly in the field always try to find the location with abundance of flowers. Bee starts from a random location and a random velocity. Each bee has a change of velocity and position at each step. Change of Velocity of the particle is given as:

$$v_n = w v_n + c_1 \text{rand} \left( \frac{x_p - x_n}{c_1} \right) + c_2 \text{rand} \left( \frac{x_g - x_n}{c_2} \right)$$

$w_n$ is the coordinate of the particle along the $N$th dimension. $x_p$ and $x_g$ are the personal best position and global best position respectively. The personal position and value are related to individual particles. The global best position and value are equal to all individuals. $c_1$ and $c_2$ are scaling factors and rand ($\cdot$) is uniformly distributed random number in the range 0 to 1. $w$ is inertial weight and is used for controlling the convergence. Determine next position according to the equation given below:

$$x_n = x_n + v_n \times \Delta t$$

This time step whose value is chosen to be 1.

III. RESULTS AND DISCUSSIONS

In this paper, length, width and probe offset of the patch have been optimized to resonate the microstrip patch antenna at the frequency ranging from 3-8GHz. Taking the following equations Resonant frequency of the rectangular microstrip patch is given by [6]:

$$f_r = \frac{c}{2 \sqrt{\varepsilon_{\text{eff}}}}$$

(1)

Here $c$ is velocity of light.

Equation for $\varepsilon_{\text{eff}}$ is given as below:

$$\varepsilon_{\text{eff}} = \frac{\varepsilon_r + 2}{2} \left( 1 + \frac{12h}{W} \right)^{-0.5}$$

(2)

The resonant length of patch is not exactly equal to the physical length due to the fringing fields on the sides of patch. Effective length $L_{\text{eff}}$ of patch is longer than its physical length and is given as:

$$L_{\text{eff}} = (L + 2\Delta L)$$

(3)

Increase in patch length ($\Delta L$) is given as:

$$\Delta L = 0.412 \frac{h (\varepsilon_{\text{eff}} + 0.5) (1 + 0.264)}{(\varepsilon_{\text{eff}} - 0.25) \left( \frac{W}{h} \right)^{1.8}}$$

(4)

Considering the fringing fields on sides of the patch, resonant frequency of patch is given as [6]:

$$f_r = \frac{c}{2 L_{\text{eff}} / \varepsilon_{\text{eff}}}$$

(5)

Equation (6) gives the width of microstrip patch.

$$W = \frac{c}{2 f_r \sqrt{\varepsilon_{\text{eff}} - 1}}$$

(6)
Design parameters chosen for microstrip patch antenna are

1. Center frequency ranges from 3-8GHz
2. The substrate material is Duroid
3. Dielectric constant of the material is 2.4. Substrate thickness is 1.578mm

IV. CONCLUSION

It can be concluded that the use of PSO saves time as compared to the design of patch antenna without using optimization algorithm and also PSO restricts the variation from center frequency. Return loss plot showed that microstrip patch antenna resonated exactly at the center frequency with the use of PSO.
