# Matching Domination of Kronecker Product of Two Graphs 

P. Bhaskarudu<br>S.V. Arts College, Andhra Pradesh<br>bhaskarudu1964@yahoo.co.in

#### Abstract

A dominating set $D$ is called a connected dominating set, if it induces a connected sub-graph in G. Since a dominating set must contain at least one vertex from every component of $G$, it follows that a connected dominating set for a graph $G$ exists if and only if $G$ is connected. The minimum of cardinalities of the connected dominating sets of $G$ is called the connected domination number of $G$ and is denoted by $c_{c}(G)$. We have defined a new parameter called the matching dominating set and the matching domination number. We consider Kronecker product of two graphs, matching domination of product graphs and re-call the results associated with the matching domination of Kronecker product of graphs. We prove the following:

$\operatorname{In} G_{1}(k) G_{2}$ then $\operatorname{deg}\left(u_{i} ; v_{j}\right)=\operatorname{deg}\left(u_{i}\right): \operatorname{deg}\left(v_{j}\right)$.
If $G_{1}$ and $G_{2}$ are finite graphs without isolated vertices then $G_{1}(K) G_{2}$ is a finite graph without isolated vertices.
$j V G_{1}(k) G_{2} j=j V G_{1} j \boldsymbol{j} V G_{2} j . j E G_{1}(k) G_{2} j=$ ${ }_{2 j E G} \boldsymbol{G}_{1} \boldsymbol{j} \boldsymbol{V} E_{2} \boldsymbol{j}$

If $G_{1}$ and $G_{2}$ are regular graphs, then $G_{I}(K) G_{2}$ is also a regular graph. If $G_{1}$ or $G_{2}$ is a bipartite graph then $G_{l}(k) G_{2}$ is a bipartite graph.

The matching domination number of $c 4(k) K_{m}$ is 4.
If $G_{1} ; G_{2}$ are two graphs without isolated vertices then ${ }_{m}\left[G_{1}(k) G_{2}\right]={ }_{m}\left(G_{1}\right): m_{m}\left(G_{2}\right)$ where $G_{1}(k) G_{2}$, is the Kronecker product of graphs.

Keywords: Kronecker Product of Graphs, Domination Set, Domination Number, Connected Graphs, Odd Cycles, Degree, Regular Graphs, Bipartite Graphs.

## 1 INTRODUCTION

Paul M Weichsel [11] defined the Kronecker product of graphs. He has proved a characterization for the product graphs to the connected graphs. He also obtained, if $G_{1}$ and $G_{2}$ are connected graphs with no odd cycles, then has exactly two connected components. E Sampathkumar [7] has proved that for a connected graph with no odd cycles $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}=2 \mathrm{G}$ The concept of domination in graphs was first introduced by Ore[9].

## 2. KRONECKER PRODUCT OF GRAPHS

Definition 2.1

## Bhaskarudu .P; International Journal Of Advance Research, Ideas And Innovations In Technology.

If $G_{1} ; G_{2}$ are two simple graphs with their vertex sets as $V_{1}: f_{1} ; u_{2}:::::: g$ and $V_{2}: f_{1} ; v_{2}:::::: g$ respectively then the Kronecker product of these two graphs is defined to be a graph with its vertex set as $V_{I} x V_{2}$, where $V_{I} \times V_{2}$ is the cartesian product of the sets $V_{I}$ and $V_{2}$ and two vertices $\left(u_{i} ; v_{j}\right),\left(u_{k} ; v_{l}\right)$ are adjacent if and only if $u_{i} ; u_{k}$ and $v_{j} ; v_{l}$ are edged in $G_{I}$ and $G_{2}$, respectively. This product graph is denoted by $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$.
An illustration of the product graph of $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$ is given as follows.

Figure 1.

Figure 2: $\mathbf{G}_{\mathbf{I}}(\mathbf{k}) \mathbf{G}_{\mathbf{2}}$
Weichsel [11] has proved that if $G_{I} ; G_{2}$ are connected graphs then $G_{I}(k) G_{2}$ is connected if and only if either $G_{I}$ or $G_{2}$ contains an odd cycle. It was further proved that if $G_{1} ; G_{2}$ are connected graphs with no odd cycle then $G_{l}(\mathrm{k}) \mathrm{G}_{2}$ is a disconnected graph. Sampathkumar [32] has proved that, If $G$ is connected graph with no odd cycles then $G(k) K_{2}=2 G$.

Theorem 2.2
In $G_{I}(k) G_{2}$ then $\operatorname{deg}\left(u_{i} ; v_{j}\right)=\operatorname{deg}\left(u_{i}\right): \operatorname{deg}\left(v_{j}\right)$.
Proof:
Suppose $\operatorname{deg}\left(\mathrm{u}_{\mathrm{i}}\right)=\mathrm{m}$ and $\operatorname{deg}\left(\mathrm{v}_{\mathrm{j}}\right)=\mathrm{n}$.
i.e., $u_{i}$ is adjacent with vertices $u_{1} ; u_{2} ;::::: u_{m}$ in $G_{I}$ and $v_{j}$ is adjacent with vertices $v_{1} ; v_{2} ;::::: ; v_{m}$ in $G_{2}$. Then in the product graph $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$, the vertex $\left(\mathrm{u}_{\mathrm{i}} ; \mathrm{v}_{\mathrm{j}}\right)$ is adjacent with following vertices.

## Bhaskarudu .P; International Journal Of Advance Research, Ideas And Innovations In Technology.

| $\left(u_{1} ; v_{1}\right)$ | $\left(u_{1} ; v_{2}\right)$ | $::$ | $\left(u_{1} ; v_{n}\right)$ |
| :---: | :---: | :---: | :---: |
| $\left(u_{2} ; v_{1}\right)$ | $\left(u_{2} ; v_{2}\right)$ | $::$ | $\left(u_{2} ; v_{n}\right)$ |
| $\cdot$ | . | . |  |
| $\cdot$ | . | $\cdot$ | . |
| $\cdot$ | $\cdot$ | $\cdot$ |  |
| $\left(u_{m} ; v_{1}\right)$ | $\left(u_{m} ; v_{2}\right)$ | $::$ | $\left(u_{m} ; v_{n}\right)$ |.

Also any other vertex $u_{k} ; v_{l}$ in $G_{l}(K) G_{2}$ is not adjacent with $\left(u_{i} ; v_{j}\right)$. If $k>m$ or $l>n$. For $u_{i}$ is not adjacent with $u_{k}$ if $k>m$ and $v_{j}$ is not adjacent with $\mathrm{v}_{1}$ if $\mathrm{l}>\mathrm{n}$.
Hence $\operatorname{deg}\left(u_{i} ; v_{j}\right)=\operatorname{deg}\left(u_{i}\right): \operatorname{deg}\left(v_{j}\right)$
Theorem 2.3
If $G_{I}$ and $G_{2}$ are finite graphs without isolated vertices then $G_{I}(K) G_{2}$ is a finite graph without isolated vertices.
Proof:
Since $G_{1}$ and $G_{2}$ are finite graphs, if follows that $G_{1}(K) G_{2}$ is also a finite graph by definition 2.1 since $G_{1}$; $G_{2}$ do not have isolated vertices.
$\operatorname{deg}_{G} I\left(u_{i}\right) 6=0$ for any i and so also $\operatorname{deg}_{G} I\left(v_{j}\right) 6=0$ for any $j$. Thus $\operatorname{deg}_{G} I(\mathrm{k}) \mathrm{G}_{2}\left(\mathrm{u}_{\mathrm{i}} ; \mathrm{v}_{\mathrm{j}}\right) 6=0$ for any i and j (by Theorem 2.3). So $\mathrm{G}_{I}(\mathrm{~K}) \mathrm{G}_{2}$ do not have any isolated vertices.

It can be easily seen that, the number of vertices $\mathrm{G}_{1}(\mathrm{~K}) \mathrm{G}_{2}$ is the product of number of vertices in $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ and the number of edges in $\mathrm{G}_{1}(\mathrm{~K}) \mathrm{G}_{2}$ is twice the product of the number of edges in $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$.

Theorem 2.4
(i) $\mathrm{j}^{\mathrm{V}} \mathrm{G}_{l}(\mathrm{k}) \mathrm{G}_{2} \mathrm{j}={ }^{\mathrm{V}} \mathrm{G}_{I} \mathrm{jj}^{\mathrm{V}} \mathrm{G}_{2} \mathrm{j}$

Proof:
It follows from the definition $2.1, \mathrm{jV}_{\mathrm{G} I(\mathrm{k}) \mathrm{G} 2} \mathrm{j}=\mathrm{j} \mathrm{V}_{\mathrm{G} 1} \mathrm{jj} \mathrm{V}_{\mathrm{G} 2} \mathrm{j}$
we know that $\mathrm{j} \mathrm{E}_{\mathrm{G} I} \mathrm{j}=\mathrm{e}_{I}=\underline{I}_{2} \mathrm{P}_{\mathrm{i}} \mathrm{V} \boldsymbol{\mathrm { d }}\left(\mathrm{u}_{\mathrm{j}}\right)$
and $\mathrm{jE}_{\mathrm{G} 2} \mathrm{j}=\mathrm{e}_{2}=\underline{1}_{2} \mathrm{P} \quad \mathrm{d}\left(\mathrm{v}_{\mathrm{j}}\right)$
Now

$$
\begin{aligned}
& \text {; } \mathrm{V} \text {. } \\
& 1 \\
& \text { X } \\
& { }^{j E} G_{l}(k) G_{2}{ }^{j}=\overline{2} \quad d\left(u_{i} ; v_{j}\right) \\
& \text { i; j }
\end{aligned}
$$

(By Theorem 2.2)

$$
\begin{aligned}
& 1 \\
& \text { X } \\
& =\overline{2} \mathrm{f} \quad \mathrm{~d}\left(\mathrm{u}_{\mathrm{i}}\right) \mathrm{d}\left(\mathrm{v}_{\mathrm{j}}\right) \mathrm{g} \\
& \text { i; j } \\
& 1 \\
& =\overline{2} \mathrm{f}^{\mathrm{X}} \mathrm{~d}\left(\mathrm{u}_{\mathrm{i}}\right) \mathrm{g} \mathrm{f}^{\mathrm{X}} \mathrm{~d}\left(\mathrm{v}_{\mathrm{j}}\right) \mathrm{g} \\
& \text { i } \quad j \\
& 1 \\
& ={ }_{2} \mathrm{f}^{2 \mathrm{e}} \boldsymbol{1} \boldsymbol{g f ^ { 2 e }} \boldsymbol{2}={ }^{2} \mathrm{j}^{\mathrm{E}} \mathrm{G}_{\boldsymbol{1}} \mathrm{jj}^{\mathrm{V}} \mathrm{E}_{2} \mathrm{j}
\end{aligned}
$$

Theorem 2.5
If $G_{I}$ and $G_{2}$ are regular graphs, then $G_{I}(K) G_{2}$ is also a regular graph.
Proof:
Suppose $G_{1}$ is a $k_{1}$ - regular graph and $G_{2}$ is a $k_{2}$ - regular graph then $\operatorname{deg}\left(\mathrm{u}_{1}\right)=\mathrm{k}_{1} ; 8 \mathrm{u}_{1} \mathrm{~V}_{1}$ and

$$
\operatorname{deg}\left(v_{j}\right)=k_{2} 8 v_{j} V_{2}
$$

Let $\left(\mathrm{u}_{\mathrm{i}} ; \mathrm{v}_{\mathrm{j}}\right)$ be any vertex in $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$ then (By Theorem 2.2)

$$
\operatorname{deg}\left(u_{i} ; v_{j}\right)=\operatorname{deg}\left(u_{i}\right): \operatorname{deg}\left(v_{j}\right)=k_{1} k_{2}
$$

Thus every vertex in $G_{I}(k) G_{2}$ is of degree $\mathrm{k}_{1} \mathrm{k}_{2}$ i.e., $\mathrm{G}_{I}(\mathrm{k}) \mathrm{G}_{2}$ is $\mathrm{k}_{I} \mathrm{k}_{2}$ - regular.
Remark 2.6
However, it is to be noted that if $G_{I} ; G_{2}$ are simple graphs then $G_{I}(k) G_{2}$ can never be a complete graph, for $\left(u_{i} ; v_{j}\right)$ is not adjacent with $\left(u_{i} ; v_{k}\right)$ for any $\mathrm{j} 6=\mathrm{k}$ (By definition 2.1)

Theorem 2.7
If $\mathrm{G}_{1}$ or $\mathrm{G}_{2}$ is a bipartite graph then $\mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$ is a bipartite graph.
Proof:
Suppose $\mathrm{G}_{I}$ is bipartite graph with bipartition $(\mathrm{X}, \mathrm{Y})$ where

$$
\begin{aligned}
& X=f_{1} ; x_{2} ;:::::::: ; x_{m} g \\
& Y=f_{1} ; y_{2} ;:::::::: ; y_{n} g
\end{aligned}
$$

Let $\mathrm{V}_{2}=\mathrm{fv}_{1} ; \mathrm{v}_{2} ;::::::::: \mathrm{v}_{\mathrm{r}} \mathrm{g}$
Then in $\mathrm{G}_{I}(\mathrm{k}) \mathrm{G}_{2}$ the vertex set is

| $\mathrm{f}\left(\mathrm{x}_{1} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{x}_{1} ; \mathrm{v}_{2}\right)$ | $::$ |  |
| :---: | :---: | :---: | :---: |
| $\left(\mathrm{x}_{2} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{x}_{2} ; \mathrm{v}_{2}\right)$ | $::$ | $\left(\mathrm{x}_{1} ; \mathrm{v}_{\mathrm{r}}\right)$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\left(\mathrm{x}_{2} ; \mathrm{v}_{\mathrm{r}}\right)$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\left(\mathrm{x}_{\mathrm{m}} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{x}_{\mathrm{m}} ; \mathrm{v}_{2}\right)$ | $::$ | $\left(\mathrm{x}_{\mathrm{m}} ; \mathrm{v}_{\mathrm{r}}\right)$ |
| $\left(\mathrm{y}_{1} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{y}_{1} ; \mathrm{v}_{2}\right)$ | $::$ | $\left(\mathrm{y}_{1} ; \mathrm{v}_{\mathrm{r}}\right)$ |
| $\left(\mathrm{y}_{2} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{y}_{2} ; \mathrm{v}_{2}\right)$ | $::$ | $\left(\mathrm{y}_{2} ; \mathrm{v}_{\mathrm{r}}\right)$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\left(\mathrm{y}_{\mathrm{m}} ; \mathrm{v}_{1}\right)$ | $\left(\mathrm{y}_{\mathrm{m}} ; \mathrm{v}_{2}\right)$ | $::$ | $\left(\mathrm{y}_{\mathrm{m}} ; \mathrm{v}_{\mathrm{r}}\right) \mathrm{g}$ |

Now, no two vertices of the form $\left(\mathrm{x}_{\mathrm{i}} ; \mathrm{v}_{\mathrm{j}}\right)$ and $\left(\mathrm{x}_{\mathrm{k}} ; \mathrm{v}_{\mathrm{l}}\right)$ are adjacent since $\mathrm{x}_{\mathrm{i}}$ and $\mathrm{x}_{\mathrm{k}}$ are not adjacent. Similarly, no two vertices of the form $\left(y_{i} ; v_{j}\right)$ and $\left(y_{k} ; v_{l}\right)$ are adjacent since $y_{i} ; y_{k}$ are not adjacent. Thus $G_{I}(k) G_{2}$ is a bipartite graph with bipartition.
${ }^{\mathrm{X}} \mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$ and ${ }^{\mathrm{Y}} \mathrm{G}_{1}(\mathrm{k}) \mathrm{G}_{2}$
Where

$$
X_{G l(k) G 2}=f\left(x_{i} ; v_{j}\right)=i=1 ; 2 ;::: ; m ; j=1 ; 2 ;:::: ; r g
$$

and

$$
\mathrm{Y}_{\mathrm{G} 1(\mathrm{k}) \mathrm{G} 2}=\mathrm{f}\left(\mathrm{y}_{\mathrm{i}} ; \mathrm{v}_{\mathrm{j}}\right)=\mathrm{i}=1 ; 2 ;::: ; \mathrm{n} ; \mathrm{j}=1 ; 2 ;::: ; \mathrm{rg}
$$

## 3. MATCHING DOMINATION NUMBER

Definition 3.1
A set $S V$ is said to be a dominating set in a graph G if every vertex in V/S is adjacent to some vertex in $S$ and the domination number ${ }^{00}$ of G is defined to be the minimum cardinality of all dominating sets in G. We have introduced a new parameter called the matching domination set of a graph.

It is defined as follows:
Definition 3.2
A dominating set of a graph $G$ is said to be matching dominating set if the induced subgraph $<\mathrm{D}>$ admits a perfect matching.
The cardinality of the smallest matching dominating set is called matching domination number and is denoted by m Illustration

Figure 3:
In this graph $\{a, b, c, f, e, g\}$ is a matching domination set, since this is a dominating set and the induced subgraph $\{a, b, c, e, f, g\}$ has perfect matching formed by the edges of, bc, eg, $\{a, b, e, f\}$ is also matching dominating set. Similarly, $\{a, b, c, g\}$ is a matching dominating set where the induced subgraph of this set admits a perfect matching given by the edges be, ag.

However, there are no matching dominating sets of lower cardinality and it follows that the matching domination number of the graph in figure 3 is 4 . Thus a graph can have many matching dominating sets of minimal cardinality. We make the following observations as an immediate consequence.
(a) Not all dominating sets are matching domination sets. For example in figure $3,\{\mathrm{a}, \mathrm{c}, \mathrm{e}\}$ is a dominating set but it is not a matching dominating set.
(b) The cardinality of matching dominating set is always even. The matching dominating set D of a graph requires the admission of a perfect matching by the induced subgraph $\langle\mathrm{D}\rangle$. Thus it is necessary that D has an even number of vertices for admitting a perfect matching.
(c) Not all dominating sets with an even number of vertices are matching dominating sets. For example in figure $3,\{b, d, g, f\}$ is a dominating set containing an even number of vertices, but induced subgraph formed by these four vertices does not have a perfect matching.
(d) The necessary condition for a graph $G$ to have to match dominating set is that $G$ is a graph without isolated vertices. The matching domination number of the graph $G$ (figure 3 ) is 4 , whereas the domination number is $2 ;\{\mathrm{a}, \mathrm{d}\}$ being a minimal dominating set. If G is a graph with isolated vertices then any dominating set should include these isolated vertices and consequently, the induced subgraph of this set containing isolated vertices will not admit a perfect matching.

Theorem 3.3
The matching domination number of $\mathrm{c}_{4}(\mathrm{k}) \mathrm{K}_{\mathrm{m}}$ is 4 .
Proof:
Let $\mathrm{V}\left(\mathrm{C}_{4}\right)=\mathrm{u}_{1} ; \mathrm{u}_{2} ; \mathrm{u}_{3} ; \mathrm{u}_{4}$ and $\mathrm{V}\left(\mathrm{K}_{\mathrm{m}}\right)=\mathrm{fv}_{1} ; \mathrm{v}_{2} ; \ldots: ; \mathrm{v}_{\mathrm{m}} \mathrm{g}$
It can be easily seen that $\mathrm{f}\left\langle\mathrm{u}_{1} ; \mathrm{v}_{1}\right\rangle ;\left\langle\mathrm{u}_{2} ; \mathrm{v}_{2} ;\left\langle\mathrm{u}_{1} ; \mathrm{v}_{2}\right\rangle ;\left\langle\mathrm{v}_{2} ; \mathrm{v}_{1}\right\rangle \mathrm{g}\right.$ will be a matching dominating set. The graph cannot have a matching dominating set of cardinality two, for if $f\langle x ; y\rangle ;\langle u ; v\rangle g$ is a matching dominating set of $C_{4}(k) K_{m}$, it will not saturate the vertices $\langle x ; v\rangle ;\langle u ; y\rangle$.

Hence the minimal matching domination number is 4 which is the same as the product of the matching domination number of $\mathrm{C}_{4}$ and $\mathrm{K}_{\mathrm{m}}$.

$$
\begin{gathered}
=2 \mathrm{~d}_{4}^{4} \mathrm{e}: 2 \\
=4
\end{gathered}
$$

Illustrate for the above theorem

Figure 4: $\mathrm{C}_{4}$

Figure 5: K5

Figure 6: $\mathrm{C}_{4}(\mathrm{~K}) \mathrm{K}_{5}$

In general, we can prove that the matching domination number of product graph is equal to the product of matching domination numbers of the graphs.

Theorem 3.4
If $G_{I} ; G_{2}$ are two graphs without isolated vertices then ${ }_{m}\left[G_{I}(k) G_{2}\right]={ }_{m}\left(G_{I}\right):{ }_{m}\left(G_{2}\right)$ where $G_{I}(k) G_{2}$, is the Kronecker product of graphs defined in 2.1.

Proof:
Let $G_{I}$ be a graph with $p_{I}$ vertices and $G_{2}$ be a graph with $\mathrm{p}_{2}$ vertices. Let $\mathrm{D}_{I}=\mathrm{fv}_{1} ; \mathrm{v}_{2} ;::::::::: ;$;
$\mathrm{V}_{2} \mathrm{~g} \mathrm{~g}$
and $D_{2}=\mathrm{fw}_{1} ; \mathrm{w}_{2} ;::::::::: ; \mathrm{w}_{2 \mathrm{~s}} \mathrm{~g}$
be minimal dominating sets of $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ respectively. Where $\mathrm{f}\left(\mathrm{v}_{1} ; \mathrm{v}_{2}\right) ;\left(\mathrm{v}_{3} ; \mathrm{v}_{4}\right) ;::::::\left(\mathrm{v}_{2_{\mathrm{r}} 1} ; \mathrm{v}_{2}\right) \mathrm{g}$ and $\mathrm{f}\left(\mathrm{w}_{1} ; \mathrm{w}_{2}\right) ;\left(\mathrm{w}_{3} ; \mathrm{w}_{4}\right) ;:::::\left(\mathrm{w}_{2_{\mathrm{s}}}\right.$; $\mathrm{w}_{2 \mathrm{~s}}$ )g )) are pairs of adjacent vertices which constitute perfect matching in the induced subgraph $<\mathrm{D}_{1}>$ and $<\mathrm{D}_{2}>$ of $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ respectively.
Now consider Cartesian product of $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$
$\mathrm{D}_{1 \times \mathrm{XD}}^{2}=\mathrm{f}\left(\mathrm{v}_{\mathrm{i}} ; \mathrm{w}_{\mathrm{j}}\right)=1 \quad \mathrm{i} \quad 2 \mathrm{r} ; 1 \quad \mathrm{j} \quad 2 \mathrm{sg}$
Let ( $\mathrm{v} ; \mathrm{w}$ ) be any vertex of $\mathrm{G}_{1}(\mathrm{~K}) \mathrm{G}_{2}$. There exists a vertex $\left(\mathrm{v}_{\mathrm{x}} ; \mathrm{w}_{\mathrm{y}}\right) \mathrm{D}_{1} \mathrm{xD} \mathrm{D}_{2} \quad$ such that v is adjacent to
$\mathrm{v}_{\mathrm{x}}$ and w are adjacent to $\mathrm{w}_{\mathrm{y}}$. Thus $\mathrm{D}_{I} \mathrm{XD}_{2}$ is a dominating set of $\mathrm{G}_{I}(\mathrm{~K}) \mathrm{G}_{2}$. Deletion of any vertex in
$D_{1 \times D} D_{2}$ does not make $D_{I X D} D_{2}$ a dominating set any more. For, if $\left(v_{i} ; w_{j}\right)$ is deleted from $D_{I} X D_{2}$ where $v_{i}$ is adjacent to vertices $\mathrm{fv}_{\mathrm{i}} 1 ; \mathrm{v}_{\mathrm{i} 2}$;
 adjacent to any of the vertices of $\mathrm{D}_{1} \times \mathrm{D}_{2}$. Moreover, the minimality of $\mathrm{D}_{1} \mathrm{XD}_{2}$ can also be deduced from the following observation. "Suppose $A x B$ is a matching dominating set of $G_{I}(K) G_{2}$ then $A$ and $B$ are matching dominating sets of $G_{I}$ and $G_{2}$ respectively". Consequently it follows that $D_{I X D}$ is a minimal dominating set of $G_{I}(K) G_{2}$. Further, it is also a matching dominating set for the vertices $\left(\mathrm{v}_{1} ; \mathrm{w}_{2}\right) ;\left(\mathrm{v}_{2} ; \mathrm{w}_{1}\right) ;\left(\mathrm{v}_{1} ; \mathrm{w}_{1}\right) ;\left(\mathrm{v}_{2} ; \mathrm{w}_{2}\right) ;\left(\mathrm{v}_{1} ; \mathrm{w}_{3}\right) ;\left(\mathrm{v}_{2} ; \mathrm{w}_{4}\right) ;\left(\mathrm{v}_{1} ; \mathrm{w}_{4}\right) ;\left(\mathrm{v}_{2} ; \mathrm{w}_{3}\right) ;::::::$ forms a perfect matching in the induced subgraph $\left\langle\mathrm{D}_{1 \times \mathrm{X}_{2}}\right\rangle$. Thus $\mathrm{D}_{1} \mathrm{XD}_{2}$, is a matching dominating set of minimum cardinality.

Hence ${ }_{\mathrm{m}}\left[\mathrm{G}_{I}(\mathrm{~K}) \mathrm{G}_{2}\right]={ }_{\mathrm{m}}\left(\mathrm{G}_{1}\right):{ }_{\mathrm{m}}\left(\mathrm{G}_{2}\right)$ :

$=f u_{1} ; u_{2} g x f v_{1} ; v_{2} ; \mathrm{v}_{4} ; \mathrm{v}_{5} \mathrm{~g}$

## CONCLUSION

The study of Kronecker product graphs, the matching domination of Kronecker product graphs has been providing us sufficient stimulation for obtaining some in-depth knowledge of the various properties of the graphs. It is hoped that encouragement provided by this study of these product graphs will be a good straight point for further research.
