ABSTRACT

This project's main objective is to integrate multiple bank accounts into one single smart card. Many bank charges ATM usage fees from the customers for different transactions. At present day, every customer has an individual ATM card for each and every bank in which he/she maintains account. So, while handling the cards, many passwords are involved. In order to overcome these difficulties, we embedded more than one bank account of the user in a single ATM smart card, therefore letting the user to swipe the card so that the respective individual can select the bank from which he/she is interested to carry out transaction.

Keywords— *Security, 12-digit RFID, Biometrics, GSM module*

1. INTRODUCTION

Modern ATMs are implemented with high-security protection measures. They work under complex systems and networks to perform transactions. The data processed by ATM's are usually encrypted, but hackers can employ discreet hacking devices to hack accounts and withdraw the account's balance. Hence, to avoid such unauthorized transactions and to protect the confidentiality of the user, we raised the bars by introducing an additional security measure such as the biometrics.

In the proposed method, the magnetic strip-based ATM card is replaced with RFID based card which have a unique number. The Arduino MEGA microcontroller is used to process the data from the sensor. The fingerprint module is used to authenticate the user. The user can register the bank details and also withdraw the amount from the registered bank details. Hence this system provides more secure and multiple bank account using single ATM card.

2. LITERATURE SURVEY

The works related to ATM security monitoring using GSM, MEMS Sensor and tracking unauthorized user using IoT devices and physical security is described in this section.

(a) The model discussed by Venka Reddy Maram, Mirza Sajid Ali Baig, Narsappa Reddy is Advanced Security Management System for ATM's using GSM and MEMS. The theft movement is observed by the MEMS sensor and sends a request to the microcontroller which will automatically lock the door, represented with the help of DC motor and send a message through GSM. A buzzer sound is produced to alert the security. The door will be unlocked with the switch which is present outside the room.

(b) The model discussed by Moturi Phalguna Satishi, Bala Kishore is Implementation of bank security system using GSM and IOT. Here, when any disturbance takes place for the ATM then data is sent through IoT and door is automatically closed. Then an alert is sent to the surrounding area using buzzer, at the same time total data will be uploaded in web page using IoT and puts alert message to the concerned person.

(c) The Author Aman Kumar discussed Advanced security system for ATM where there are 3 phases of security, 1). Palm scanning, 2). Retina scanning, 3). If any misuse gas is

released making the person unconscious. In performing the transaction gate will closed. The wall of phases will of strong fibre that cannot cut by any Gas. When he wants to come out then need to press a button that button connected through gate then gate will open. The final phase has Gas that can power for unconscious. And all CCTV cameras monitored by near police station.

(d) The work presented by Sudhakar Hallur, Manjunath Bajantri, Sagar Santaji shows ATM security using GSM Technology where each user is provided with a unique card and number where the person can do the transactions privately. A provision to give physical security to the machine is being discussed here.

(e) The paper of Shinde S.P, Chingale R.R, Dhane D.C, Vader P.B discusses ATM machine security sensor using GSM and MEMS sensor. Here when the movement of machine and the vibration is sensed using vibration and MEMS sensor, the buzzer produces a beep sound. DC Motor is used for closing the door. Smoke detector is used here to sense the gaseous or smoke near ATM machine.

3. PROPOSED SYSTEM

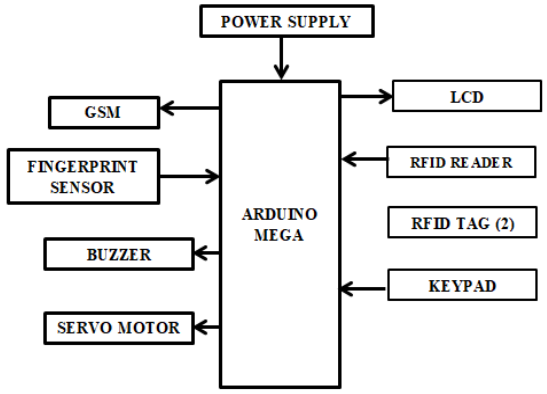

Fig. 1: Block Diagram

In the proposed method, the magnetic strip-based ATM card is replaced with RFID based card which have a unique number. The Arduino MEGA microcontroller is used to process the data from the sensor. The user can register the bank details and also withdraw the amount from the registered bank details. Hence this system provides more secure and multiple bank account using single ATM card.

A power supply of +5V is given to the circuit as an input. Arduino mega acts as a microcontroller that simultaneously stores data given to it. The ATM card consist of a magnetic strip containing a unique 12-digit number which acts as an RFID tag. This tag is read by a passive RFID reader (here EM-18 module) which is connected to the microcontroller through serial communication (UART). A 4x4 keypad is connected to the microcontroller that acts as an input to enter the 4-digit pin. Once the authenticity of the pin is confirmed the finger print of the user is verified using an optical fingerprint reader. The money is deposited or withdrew through servo motor that rotates 180 degree if the finger print matches the biometric data. On the other hand, if the finger print does not match, the buzzer starts ringing. Finally, irrespective of success or failure of the transaction a message or call is sent to the user through GSM module (SIM800L) which is 2G based network that uses AT commands.

4. RESULTS AND DISSCUSSIONS

The proposed scheme of MAASC (Multiple Account Access using Single ATM Card) provides the individual, the comfort of accessing users multiple accounts of different banks using a single card. Also, it provides the user one level higher convenience than the existing system.

Advantages of proposed system:

(a) Single ATM card provides more convince of using multiple bank transactions

(b) Higher security based on the biometric module

5. CONCLUSION

In this project, the user can manage his/her multiple accounts in various banks with the help of this single smart card ATM which provides easy access and reduces the complexity of managing more than one ATM card and their respective passwords. Here we provided the user with biometrics in order to create a viable method of identifying user's sufficient security level for the ATM system. The security features were enhanced largely for the stability and reliability of the owner's recognition. The whole system is built on the technology of embedded system which makes the system safe, reliable and easy to implement. Hence the vulnerabilities of the ATM fraud are reduced.
