ABSTRACT

This research relating to the effects of the universal system on the environment and living beings in the course of time intervals and understanding the survival systems and practical observation.

Keywords— Psychology, Artificial Intelligence, and Astrobiology

As in the study of Psychology and artificial intelligence, as per observation in line with astronomy the effects of rotating earth on surrounding places and living beings in the form of vibration that causes disturbances in the movement of actions, health habits and living styles.

The position where one is standing is not the same in the sense of universal position, when it is seen from the top of the sky the position will be changing as like the needles in the clock. The diagram reflects the position of planet earth at different times in a day, how it changes and impacts the environment and living beings finally.

International Journal of Advance Research, Ideas and Innovations in Technology

As one is standing on the earth the vibrating effects will be observed by the body which results in behavioral changes. The vibrations change from minute to minute, hour to hour and day to day on some days we will observe more adverse changes and some days will be seen as normal. Routine misbalancing symptoms consists of body disorders including on surrounding places and living beings. The changes can be identified as the cracks and displacements.

In living beings sense organs notice and brain gets cautious. It is noticed disorders like soil erosions gets submerged and get normal in the time intervals, where as in living beings there will be inbuilt mechanism gets activated and bring the changes to normal in the time intervals by taking necessary precautions.

Practical observation of earth movements with the technique of gravity followed in line with the astronomical studies. As per practical observation the changes of movement of earth can be identified by keeping a thread string on the side of a wall, it is noticed on the bottom of the thread there is a gap between the thread and the wall. In continuation of observation if the thread is kept on the four sides of the pillar it is observed four different measurements, changes from morning to evening and one day to other day.

In the long-time observation, it is observed the measurements gets changed on first ten to fifteen days in the month before the full moon and after the full moon. By the below diagram it is observed the slightly different changes in the position of the string.

The three months observation reading noted as below at two different positions

By the above observation it is identified that the measurements can be applied to any of the living or non living object similarly and the relativity causes different kinds of effects basing on the objects and their sustainability. By this research it is concluded by observing the movement of the earth we can estimate the effects and helpful in finding the remedies by taking corrective steps.
